POWER BI WEEK – 10 REPORT

INTRODUCTION

Real estate analytics helps analyze housing data to understand property prices, property sizes, and market trends. In this activity, Power BI is used to create an interactive Real Estate Analytics Dashboard using the King County House Sales dataset prepared in Week 9.

The dashboard includes key performance indicators (KPIs), charts, and filters to explore house prices, living areas, property categories, and renovation status. This activity provides practical experience in data visualization, dashboard development, and interactive data analysis using Power BI.

CONCLUSION

The Week 10 activity successfully developed an interactive Real Estate Analytics Dashboard using Power BI and the King County House Sales dataset prepared in Week 9. KPI cards were created to display average house price, total house sales, median house price, and renovated property count.

Charts were used to analyze house price trends, property size categories, price categories, and renovation status. Interactive slicers were added to filter the data by sale year, number of bedrooms, and renovation status. The dashboard was tested to verify that the visuals responded to filter selections.

Overall, this activity provided practical experience in data visualization, KPI development, chart creation, interactive filtering, and dashboard design using Power BI. The completed dashboard helps users explore housing data and understand real estate trends more effectively.
